

Surgical outcomes of trabeculectomy and glaucoma drainage implant for uveitic glaucoma and relationship with uveitis activity

Clinical and Experimental Ophthalmology, 02/10/2017
Kwon HJ, et al.

The focus of this study was to investigate the surgical effects of trabeculectomy and glaucoma device implant (GDI) surgery for uveitic glaucoma. It laid emphasis on the study of the effect of uveitis activity on surgical outcomes. The conclusion derived was that surgical success rate of GDI was not significantly different to trabeculectomy for uveitic glaucoma. Regular monitoring, early and prolonged intensive treatment of ocular inflammation is necessary for surgical success, specifically after trabeculectomy.
